

club design for elderlies in Rasht approaching increase the sense of life expectancy

fereshte purshaban*,arash mehrgani,

Today increasing the level of health in human societies has increased longevity and life expectancy in most advanced and developing countries. As urban life expands, increasing the busy people, increasing the cost of living Etc the desire or the possibility of having a child has decreased for many families which has reduced the birth rate in these types of societies, As a result the Aged population is gradually multiplying the population of the youth of society. So the elderly have a large part of society that the importance of paying attention to this part of society is doubled. Reduce social relationships, Disagreement among generations of society and elderly health needs Has caused that elderly people are volunteered or unwittingly attracted to spaces that was for them and in addition to providing security and Their mental relaxation, provide appropriate medical services. In all advanced countries, psychologists and architects are working closely together so this big part of society who considered as retired and untapped in the past Create a force that is the balance of society. The valuable experience of this age group along with reducing their physiological abilities Specific conditions apply to spaces used by the elderly that Architectural design should focus on these spaces. Designing the center can provide the elderly daily and entertainment facilities, medical facilities Etc Related to them can increase the sense of hope of life in them Along with increasing the level of health and quality of life, to make the community benefit their valuable experiences. The purpose of this study is to design for the elderly in Rasht city with analytical method Based on theoretical and field studies. It is hoped that the results of this research will be a solution for architects who work in this field.
