

# **design of Aartistic and Intellectual Development Center for 7-12 years old Children with the Approach of Effect of the Provided Environment on Behavior**

Elahe Ghasemi Khangahbar\*, Dr . Hamze Gholamalizadeh,

**In designing of many of the contemporary architectural works, functions and specifications related to the building configuration are considered, instead of paying attention to the users' psychological needs. This weak point can be seen in many training and cultural spaces in Iran, too. Of course, consideration to function of the spaces and physiological necessities of the users in designing is so important, but during the recent decades, with consideration to the results pertinent to environmental psychology and mutual effects of human and environment, necessity of paying attention to the addressers' psychological needs of the constructed environments are felt more than before. as the architectural space must be able to provide mental relaxation possibility for users, therefore, training and cultural spaces of the children must be effective in actualizing of their talents and improvement of their behaviors. In order to explain this case, a research has been fulfilled in relation with the cultural buildings used by children and effect of the constructed environment on their behavior, and some factors have been studied in this regard consisting of introduction to the children's needs, introduction to environment and behavior, aesthetic factors in relation to the constructed environment and operational factors that with consideration to the aforesaid cases, it has been tried to design an environment suitable for children behavioral templates.**

**Keywords : Keywords: Constructed environment, human, behavior, psychology.**
