# Space Analysis of Tuberculosis in west of Guilan

Kamran Mardvani Rik\*,

**Tuberculosis is an inflectional disease that was discovered by a German Physician “Robert Koch” (1843-1910) in 1882 March 24th. After this finding, it became one of the professional programs of physicians and experts to fight or prevent this disease. Unfortunately although there have been many efforts to control it, this disease is an important problem in public health in Iran, as other progressing countries. Regarding the dispersion of this disease in most parts of Iran, Guilan province is also one of the districts that suffer it annually. This research is descriptive - analytical along with library, documentary and field studies on space analysis of Tuberculosis in west of Guilan province. The Main aim is to probe the rate of spreading Tuberculosis in the province according to the population of every part and also we pay attention to the reasons of affection to this disease. Finding out the rate of spreading this disease and local dispersion is very vital and important for controlling it, because WHO (World Health Organization) has called Tuberculosis as an emergency in the Earth!**
