

# **Rasht industrial estate worker design complex with approach to industrialization**

Mahan Masoumi\*,Kiomars Javanmardi,

**With the increasing growth of industries and the construction of many factories to meet human needs, the need for workers to work in industries increased day by day, so that the working population of cities was not able to meet this need, and with the industrialization of cities their living conditions improved. These two factors triggered the migration of rural populations to cities. Increasing labor migration to cities and industrial centers affected all aspects of human urban life, one of which being the provision of housing for immigrants. Housing in cities with large industries and accommodating the immigrant population of these industries is one of the major problems in these cities today. The growing need of the community for building and housing, the need to use new building systems and materials to increase the speed of construction, lightening, extend the useful life and make buildings more resistant to earthquake. In this regard, it is inevitable to upgrade the scientific and professional level of the country's engineering community and to get acquainted with new building systems and materials. And it is a replacement for the traditional housing construction. Building industrialization does not mean artificialization, but industrialization of housing is a national necessity to modify consumption patterns. This research is based on the assumption that a design that is thought to meet the day-to-day needs of users with aesthetic and industrialization aspects of the land is thought to be descriptive and in some parts of it an information analysis. Quality has taken place**
